

- Using models that do not vary selection pressure across lineages yields a patently false “*too young*” estimate for the origin of **measles** (about 600 years ago)
- This estimate is refuted by clear historical records which suggest that measles is at least 1,500-5,000 years old
 - *This includes a treatise by a Persian physician Rhazes about differential diagnosis of measles and smallpox published circa 600 AD.*
- Same patterns found for corona-viruses, ebola, avian influenza and herpesvirus
