- Simple
  - single rate parameter
  - relatively compute-light
- Very robust to local variation
- Sample size ~ sites x branches
- Very low power
  - most genes are on average conserved
- No resolution
  - if selection occurred, how much of the gene was involved, and when did it happen
- Rate variation model is definitely misspecified

## Gene-wide selection

random effects over sites and branches [BUSTED]

Is there enough **image area** that is sufficiently bright; allow each pixel to be one of K (=3) colors, chosen adaptively, e.g. to minimize perceptual differences

[BUSTED]: each branch-site combination is a drawn from a K-bin (dS,dN) distribution. The distribution is estimated from the entire alignment. Tests if dN/dS>1 for some branch/site pairs in the alignment
