Illuminating the darkness in molecular evolution

Nei-Gojobori dN/dS estimate (NG86)

- For each codon C we define ES(C) and EN(C) the numbers of synonymous and non-synonymous sites of a codon
 - e.g., ES(GAA) = 1/3, EN(GAA) = 8/3.
- May also define them as fractions of substitutions that do not lead to stop codons,
 - e.g., ES(GAA) = 1/3, EN(GAA) = 7/3.
- The sum of **ES** and **EN** over all codons in a sequence gives an estimate of expected synonymous and non-synonymous **sites** in a sequence.
- For two sequences (the target of the original method), we average **ES(C)** and **EN(C)** at each site.
- EN/ES is thus the expected ratio of non-synonymous to synonymous substitutions
 counts under neutral evolution

Simple methods for estimating the numbers of synonymous and nonsynonymous nucleotide substitutions
