Gene-wide selection analysis using a branch-site method (BUSTED), SARS-CoV-2 spike

hyphy busted --srv No --alignment data/spike.fas --tree data/spike.tree --starting-points 5

Produces *spike.fas.BUSTED.json* file View in http://vision.hyphy.org/BUSTED

Based on the likelihood ratio test, there **is** evidence of *episodic diversifying selection* in this dataset (p=0.01901).

BUSTED analysis (v4.0) was performed on the alignment from /Users/sergei/Dropbox/Talks/VEME-current/data/spike.fas using HyPhy v2.5.40. This analysis **did not include** site-to-site synonymous rate variation.

BUSTED analysis - summary

West Nile Virus NS3 protein

- No statistical support for selection; ML point estimate allocates a small proportion of sites (~1%) to the selected group (dN/dS ~ 2)
- The rest of the gene is very strongly conserved (dN/dS = 0.004)

HIV-1 transmission pair

- Very strong evidence of strong episodic diversification (dN/dS ~ 100) on a small proportion of sites (2%)
- The rest of the gene evolves with weak purifying selection (dN/dS = 0.6-0.7)

SARS-CoV-2 spike

- Evidence of episodic diversification (dN/dS ~ 15) on a small proportion of sites (~2%)
- Most of the rest of the gene evolves with purifying selection (dN/dS = 0.2)
