Nei-Gojobori dN/dS estimate (NG86)

- For each codon C we define ES(C) and EN(C) the numbers of synonymous and nonsynonymous sites of a codon
 - e.g., ES(GAA) = 1/3, EN(GAA) = 8/3.
- May also define them as fractions of substitutions that do not lead to stop codons,
 - e.g., ES(GAA) = 1/3, EN(GAA) = 7/3.
- The sum of **ES** and **EN** over all codons in a sequence gives an estimate of expected synonymous and non-synonymous **sites** in a sequence.
- For two sequences (the target of the original method), we average **ES(C)** and **EN(C)** at each site.
- EN/ES is thus the expected ratio of non-synonymous to synonymous substitutions
 counts under neutral evolution

Simple methods for estimating the numbers of synonymous and nonsynonymous nucleotide substitutions

NG86 example

	Site 1	Site 2	Site 3	Site 4	Site 5	Site 6
Seq1	<u>ACA</u>	<u>ATA</u>	<u>ATC</u>	<u>TTT</u>	<u>AAT</u>	<u>CAA</u>
Syn	1	2/3	2/3	1/3	1/3	1/3
NonSyn	2	7/3	7/3	8/3	8/3	7/3
Seq2	ACA	<u>ATA</u>	ACC	<u>TTT</u>	AAC	CAA
Syn	1	2/3	1	1/3	1/3	1/3
NonSyn	2	7/3	2	8/3	8/3	7/3
Syn	1	2/3	5/6	1/3	1/3	1/3
NonSyn	2	7/3	13/6	8/3	8/3	7/3

Mean

ES = $3\frac{1}{2}$, EN = $14\frac{1}{6}$: under neutrality, we <u>expect</u> the ratio of non-synonymous to synonymous substitutions of EN/ES ~ 4.05
