

Correlation between the relative abundance of RNA viruses hosted by different organisms and meteorological conditions

UPVAtlas Highlights

UPVAtlas
Urban & Peri-urban RNA Virus Atlas

- **Deepest metatranscriptomic profiling of global cities to date.**
We examined ~3K samples (collected 1H2020), containing >100B reads to study RNA virus biology in urban environments, their hosts, and pathogenicity.
- **Our analysis uncovered two novel *Duplornaviricota* phyla** supporting the polyphyletic nature of this clade, with support from the published literature (Neri et al., 2022, Zayed et al., 2022).
- **Selection analyses of RdRp identified amino acid sites with directional selective pressures**, this may describe local adaption of viral groups.
